```

```
        all_constraints = self._get_all_constraints(coh_system)
        tested_constraints = set()

        for result in test_results:
            tested_constraints.update(result.get('constraints_tested', []))

        self.coverage_metrics['constraint_coverage'] = (
            len(tested_constraints) / len(all_constraints)
        )

        # Method coverage
        all_methods = self._get_all_methods(coh_system)
        tested_methods = set()

        for result in test_results:
            tested_methods.update(result.get('methods_tested', []))

        self.coverage_metrics['method_coverage'] = (
            len(tested_methods) / len(all_methods)
        )

class COHTestCase:
    def __init__(self, name: str):
        self.name = name

    def setup(self, coh_system):
        """Setup test environment"""
        raise NotImplementedError

    def execute(self, coh_system):
        """Execute test actions"""
        raise NotImplementedError

    def verify(self, coh_system, outcome, initial_state):
        """Verify test results"""
        raise NotImplementedError
```

B.5 Performance Optimization Guide

B.5.1 Memory Optimization

1. **Lazy Loading of Components**: Load sub-objects only when accessed
2. **Embedding Compression**: Use dimensionality reduction for embeddings
3. **Constraint Caching**: Cache constraint evaluations
4. **Incremental Updates**: Update only changed parts of the system

B.5.2 Computational Optimization

1. **Parallel Constraint Checking**: Distribute constraints across cores
2. **GPU Acceleration**: Use CUDA for neural components
3. **Query Optimization**: Optimize object graph traversals
4. **Batch Processing**: Process similar operations in batches

B.5.3 Scalability Patterns

1. **Sharding**: Distribute objects across multiple servers
2. **Replication**: Replicate frequently accessed objects
3. **Caching Layers**: Implement multi-level caching
4. **Load Balancing**: Distribute daemon execution

B.6 Deployment Guidelines

B.6.1 Containerization

```
# Dockerfile for COH System
FROM python:3.9-slim

# Install dependencies
RUN apt-get update && apt-get install -y \
    gcc g++ git && \
    rm -rf /var/lib/apt/lists/*

# Copy application
COPY requirements.txt /app/
RUN pip install -r /app/requirements.txt

COPY . /app
```

```
# Create directories
RUN mkdir -p /app/data /app/models /app/logs

# Environment variables
ENV PYTHONPATH=/app
ENV COH_ENV=production

# Run application
CMD ["python", "/app/main.py"]
```

B.6.2 Kubernetes Configuration

```yaml
# coh-deployment.yaml
apiVersion: apps/v1
kind: Deployment
metadata:
  name: coh-engine
spec:
  replicas: 3
  selector:
    matchLabels:
      app: coh-engine
  template:
    metadata:
      labels:
        app: coh-engine
    spec:
      containers:
      - name: coh-engine
        image: coh-engine:latest
        ports:
        - containerPort: 8080
        resources:
          requests:
            memory: "2Gi"
            cpu: "1"
          limits:
```

```yaml
            memory: "4Gi"
            cpu: "2"
        volumeMounts:
        - name: coh-data
          mountPath: /app/data
        - name: coh-models
          mountPath: /app/models
      volumes:
      - name: coh-data
        persistentVolumeClaim:
          claimName: coh-data-pvc
      - name: coh-models
        persistentVolumeClaim:
          claimName: coh-models-pvc
---
# Service for load balancing
apiVersion: v1
kind: Service
metadata:
  name: coh-service
spec:
  selector:
    app: coh-engine
  ports:
  - port: 80
    targetPort: 8080
  type: LoadBalancer
```
